Sing leton pattern is one of the simplest design patterns in Java. This type of design pattern comes under creational pattern as this pattern provides one of the best way to create an object.

This pattern involves a single class which is responsible to creates own object while making sure that only single object get created. This class provides a way to access its only object which can be accessed directly without need to instantiate the object of the class.

## **Implementation**

We're going to create a *SingleObject* class. *SingleObject* class have its constructor as private and have a static instance of itself.

SingleObject class provides a static method to get its static instance to outside world. SingletonPatternDemo, our demo class will use SingleObject class to get a SingleObject object.

## Step 1

Create a Singleton Class.

SingleObject.java

```
public class SingleObject {
    //create an object of SingleObject
    private static SingleObject instance = new SingleObject();

    //make the constructor private so that this class cannot be
    //instantiated
    private SingleObject() {}

    //Get the only object available
    public static SingleObject getInstance() {
        return instance;
    }
}
```

```
public void showMessage() {
    System.out.println("Hello World!");
}
```

## Step 2

Get the only object from the sing leton class.

SingletonPatternDemo.java

## Step 3

Verify the output.

```
Hello World!
```
